

Code Highlighting

Fenced code blocks are highlighted by language (highlight.js). Back to the [index](#).

Code blocks show a header with the **language** (or a **filename** if you supply one) and a **copy** button. Add a filename with `title="..."` or `lang:filename`:

```
src/main.rs
fn main() {
    println!("named via title=");
}
```

```
scripts/build.py
print("named via lang:filename")
```

Each code block has its own header: **123** toggles line numbers,  copies the source,  saves it to a file. With line numbers on, click a number to highlight that line.

Rust

```
rust
fn main() {
    let greeting = "Hello, Markdown!";
    for word in greeting.split_whitespace() {
        println!("{word}");
    }
}
```

TypeScript

```
typescript
interface Doc {
    path: string;
    content: string;
}

const render = (docs: Doc[]): number =>
    docs.reduce((n, d) => n + d.content.length, 0);
```

Python

```
python
from dataclasses import dataclass

@dataclass
class Point:
    x: float
    y: float

    def dist(self) -> float:
        return (self.x ** 2 + self.y ** 2) ** 0.5
```

Bash

```
bash
#!/usr/bin/env bash
set -euo pipefail
for f in *.md; do
    echo "Rendering $f"
done
```

JSON

```
json
{
  "name": "markdown-gui",
  "features": ["render", "mermaid", "math"],
  "fast": true
}
```

SQL

```
sql
SELECT title, COUNT(*) AS views
FROM documents
GROUP BY title
ORDER BY views DESC
LIMIT 10;
```

Plain (no language)

No language tag – rendered as monospace, not highlighted.
