

Code Highlighting

Fenced code blocks are highlighted by language (highlight.js). Back to the [index](#).

Code blocks show a header with the **language** (or a **filename** if you supply one) and a **copy** button. Add a filename with `title="..."` or `lang:filename`:

src/main.rs

```
1  fn main() {
2      println!("named via title=");
3  }
```

scripts/build.py

```
print("named via lang:filename")
```

Each code block has its own header: **123** toggles line numbers,  copies the source,  saves it to a file. With line numbers on, click a number to highlight that line.

Rust

rust

```
fn main() {
    let greeting = "Hello, Markdown!"
    for word in greeting.split_whitespace() {
        println!("{word}");
    }
}
```

TypeScript

typescript

```
1  interface Doc {
2      path: string;
3      content: string;
4  }
5
6  const render = (docs: Doc[]): number => {
7      docs.reduce((n, d) => n + d.content.length);
8  }
```

Python

python

```
1  from dataclasses import dataclass
2
3  @dataclass
4  class Point:
5      x: float
6      y: float
7
8      def dist(self) -> float:
9          return (self.x ** 2 + self.y ** 2) ** 0.5
```

Bash

bash

```
#!/usr/bin/env bash
set -euo pipefail
for f in *.md; do
    echo "Rendering $f"
done
```

JSON

json

```
1  {
2      "name": "markdown-gui",
3      "features": ["render", "mermaid"],
4      "fast": true
5  }
```

SQL

sql

```
SELECT title, COUNT(*) AS views
FROM documents
GROUP BY title
ORDER BY views DESC
LIMIT 10;
```

Plain (no language)
